Build your Day 1 support workflow

1. Get the template Open github.com/becomefde/fde-support-agent > day1. Download kaapi-day1-gemini.json. In a NEW n8n workflow use More actions > Import and choose the file.

2. Connect Gmail + AI Choose your own Gmail credential on the trigger and your Gemini API credential on Google Gemini Model. Use an accessible model and test the credential privately.

3. Create the log Google Sheets row 1: time | sender | category | draft_reply. In the Sheets node select your credential, document and tab. Keep the supplied mappings.

4. Choose Slack Connect your Slack credential and reselect a test channel such as #support. A refund creates a human-review alert. Other categories only log.

5. Run three tests Use [KAAPI-DEMO] in the subject. T01 refund: Sheet + Slack. T03 product: Sheet only. T05 Hinglish delivery: Sheet only. See TEST-EMAILS.md for exact inputs.

6. Verify, then publish Check actual Sheet rows and Slack alerts. Automatic Gmail polling is at least one minute; a manual test has different timing. The workflow drafts replies; it does not send them or approve refunds.

Use your own accounts and fictional data. Never share API keys. The imported file has no saved credentials, presenter Sheet IDs or execution data.
